re. **The emergence of Covid-19 and the measures prior to the mass vaccination**

Dear Ladies and Gentlemen

In April, we warned based on studies available at the time, that after a quick exit from the lockdown, in which the previous values for air pollution would quickly be reached again, more people belonging of the risk groups due to previous damage from particulate matter, NO₂, CO₂ and O₃ inhaled for years could go through a severe course of Covid-19.

Our warning went unheeded. The traffic surged back to old heights within a short time and immune system-supporting therapies for members of risk groups were not an issue for politicians in regard of vaccines that would soon be available. The fact that the state has a duty of care towards those affected until an effective therapy is available not either. The second wave, which was predicted early for autumn, quickly led to a sharp rise in serious cases, which are currently threatening to exceed the capacities of the hospitals and despite the prescribed protective measures bring up contact bans, which lead to serious economic and social damage.

Scientists, doctors and politicians, who continuously denied the role of particulate matter the ambient air for triggering the blockage of the defensive activity in the epithelial tissues of the lungs, the cardiovascular system, the brain and in internal organs when inhaled daily over long periods, which was demonstrated in numerous investigations, saw the solution alone in rapidly developed vaccines against SARS Cov-2 and proved to be unable to take effective measures in the field of environment and in therapies that support the immune system in those suffering from the effects of long time inhalation of PM-, NO2-, Ozone- and CO2- emissions. Driving bans in city centers for vehicles that do not meet today's emission standards were just as little an issue for them as measuring particulate matter in central shopping areas or in residential and office buildings near large streets.

To this day, many homes, hospitals, schools, companies, and offices accordingly do not have effective air purification devices that particulate matter and do not have test facilities for their visitors and employees. According to political rulers, Covid-19 should only be prevented by wearing facemasks, contact tracing and quarantine measures, which were consistently decreed despite its drastic social and economic consequences. The total ban on contact, which is now again being ordered for the holidays, shows the failure of this strategy and at the same time creates the ideal mood in the population for an emergency dispensing of the new vaccines without regular approval with clear evidence of effects and side effects, which would make the manufacturers liable, who can now deliver these data within a year, whereby the dispensing hospitals should record possible side effects in cooperation with university institutes.

Whether the message given by scientists, doctors, politicians and representatives of the pharmaceutical companies since the beginning of the pandemic that only a vaccine could resolve the problem, will pay off shall now be shown in an open mass experiment in which vulnerable people with previous illnesses, residents of homes for the elderly and the nursing staff should be vaccinated first.

If Swissmedic, as the Swiss national approval authority for drugs, announces before an evaluation of the case material that the nucleoside-analogous substance Remdesivir, which 30% of all hospitalized Covid-19 patients in Switzerland had received, did not have had any negative side effects, although such are known in the literature. This does not bode well with regard to possible side effects of vaccines, which would have to be recorded precisely now from the start. Remdesivir, like

the HIV drugs, Ritonavir and Lopinavir and the malaria drug, Hydroxychloroquine, had been given to thousands of Covid-19 patients worldwide after an emergency approval by the FDA, until the WHO officially declared its ineffectiveness for the treatment of Covid-19.

As was the case with the nucleoside-analogous substance, AZT, which, despite its known, severely damaging effects, was given to HIV-test-positive people for years allegedly without any alternative, whilst its side effects were downplayed from the outset by the donating doctors in order to ward off claims for damages. The longer-term side effects of Covid-19 vaccines could be downplayed by the dispensing doctors again, so that it would be practically impossible to record them precisely. (The fact that attempts to develop a vaccine for Covid-19 had to be stopped by the University of Queensland because study participants took a positive HIV antibody test due to its antibody enhancing effects, shows what kind of side effects could be possible here.) From the data to the registration of the Pfizer-Biontech vaccine in Britain we can learn that "it is unknown whether the COVID-19 mRNA vaccine BNT162B2 has an impact on fertility".

[HTML\] Liver injury in remdesivir-treated COVID-19 patients](https://www.theguardian.com/world/2020/dec/11/australia-terminates-university-of-queensland-vaccine-deal-with-csl-after-false-positives-for-hiv)

<https://www.theguardian.com/world/2020/dec/11/australia-terminates-university-of-queensland-vaccine-deal-with-csl-after-false-positives-for-hiv>

<https://www.gov.uk/government/publications/regulatory-approval-of-pfizer-biontech-vaccine-for-covid-19/information-for-healthcare-professionals-on-pfizerbiontech-covid-19-vaccine>

Although it is pointed out that, thanks to the vaccines, no short-term all-clear is possible and a longer-term strategy has long been demanded by politicians, governments around the world are now preaching salvation through the vaccine, which

will solve all problems from Covid-19, which were said to be caused by SARS Cov-2 viruses alone.

That after a successful vaccination, after short time new infections by Corona viruses, bacteria and fungi could turn up anywhere, due to lasting immune suppression triggered by daily inhaled NO₂, CO₂, O₃ and particulate matter is apparently no issue for them.

In their supply contracts with the individual states, the vaccine manufacturers have ruled out any liability for damages by side effects on the grounds of urgency.

A substantial strategy to reduce the emissions of particulate matter, nitrogen oxide, ozone and CO₂ is still missing, so that the fulfillment of the climate targets agreed in Paris 2015 is not in sight. Studies from all over the world that examine toll systems and other possible environmental measures show what measures in the field of passenger and freight transport could be used to achieve these goals.
