**The various new therapies against SARS-Cov-2 and its effects  
on various organs**

Ladies and gentlemen

Dear contemporaries

After Christian Drosten has admitted in an interview by  
Tagesanzeiger and the Süddeutsche Zeitung "that new properties  
were built into bat viruses in the Wuhan laboratory", the  
question remains as to how far these genetic modifications are  
responsible for the pathogenic effects of SARS-Cov-2.

**[The genetic structure of SARS-CoV-2 does not rule out a laboratory origin:  
SARS-COV-2 chimeric structure and furin cleavage site might be the result of  
genetic ...](#)**

The attempt to qualify the development of SARS-Cov-2 in the  
Wuhan laboratory as a conspiracy theory is viewed critically.

Vaccines which were developed against the SARS-Cov-2 viruses, considered to be the sole cause of Covid-19 and its severe course, were approved for mass administration after a short time, after its promoters described this alternative-less. They still want to legally enforce compulsory vaccination with these vaccines for the entire population. The administration of boosters was intended to prevent the quickly fading effect of these vaccines, especially against newly developed virus variants, which, such as the omicron variant that appeared later.

It is now becoming apparent that new variants could spread after the omicron e.g. a combination of the Delta variant with the Omicron variant.

Antibodies and drugs that have been developed alongside with the new mRNA and Virus-vector vaccines since the beginning of the pandemic and have shown to be effective in many patients. They are based both on the serum of those who have recovered as also on a variety of genetically engineered substances intended to act on individual mechanisms such as the entry of the virus into the cell and the subsequent immune reactions. Few of them are natural substances or preparations that are already known from the of similar diseases. The development of substances, which were approved for individual patient groups at short notice in rolling procedures, was in certain cases co-financed by state-institutions and institutions of the EU.

This also applies to new substances that have been developed by Christian Drosten and a subsidiary of the Charité.

The currently approved substances against Covid-19 can be found on a separate list:

<https://www.vfa.de/de/englische-inhalte>

After the billion-dollar business with antiviral-acting mRNA- and virus vector vaccines and the associated boosters, there is now a new billion-dollar business with drugs against Covid-19, its various forms and secondary diseases in individual patient groups with various, previous diseases. The side effects of these new Covid-19 drugs will have to be checked from the start, even in rolling approval procedures. Social Democrats and Greens have given up their opposition to the use of genetically engineered substances in medicine under the influence of the Covid-19 pandemic.

The genetic engineering of corona viruses, carried out in the Wuhan laboratory with the participation of US researchers, may have caused the emergence of a severe disease course, long-Covid and chronic diseases in thousands of people, which by now in many cases cannot yet be treated successfully.

In contrast, the 100 million that the Federal Office of Public Health is demanding from Parliament for these new drugs is probably just a small start.

Clean indoor air, as we have been demanding since the beginning of the pandemic, is only available in very few places. Many nurseries, schools, nursing homes, restaurants, offices and shops do not have the necessary facilities to

provide it. We welcome the fact that Tanja Stadler, the former head of the Swiss Covid Task Force, is now calling for clean air indoors as a precondition of an efficient handling of the Covid pandemic.
