Pfizer director was caught and then became violent

Martina Frei/Urs P. Gasche / 28.01.2023 at https://www.infosperber.ch/

Pfizer wants to make the corona virus "more potent" and develop vaccines for it, he said. That was a bluff, he stated afterwards.

The video received many millions of clicks within ten hours. Covid will become the cash cow for Pfizer and should ensure a thriving business for the next few years. That's what Jordon Walker said, according to his own statements being "Director, Worldwide R&D Strategic Operations and mRNA Scientific Planning" at the pharmaceutical company Pfizer.

First, Walker demanded a promise from his counterpart: "Don't tell anyone, promise me you won't tell anyone." When his counterpart agrees, Walker gets started: Viruses can mutate, he explains.
"One of the things we're exploring is: Why don't we mutate it [the virus] ourselves? In this way, we could develop preventive vaccines."
However, nobody wants a pharmaceutical company that mutates "fucking viruses". Very good care must be taken to ensure that this virus, which is being changed, does not go everywhere [Red. what is probably meant: does not escape].
That's exactly what happened in Wuhan, Walker suspects. "It doesn't make sense that this virus just showed up. That's bullshit."
Walker did not know that his casual statements were filmed in a restaurant, where he had arranged a date. However, there was no date in front of him, but a research journalist from the right-wing conservative **«Project Veritas»** with a hidden camera who recorded everything.
The video is authentic. The Pfizer Group does not deny this.

The Google subsidiary YouTube deleted the video.
The original video is no longer on YouTube. You can see it on Project Veritas site.
https://www.projectveritas.com/news/pfizer-executive-mutate-covid-via-directed-evolution-for-company-to-continue/

When the journalist asked Walker whether what Pfizer was doing wasn't "gain of function" research, Walker denied: "It's definitely not gain of function research."
What Pfizer is doing is "directed development," and that's very different from gain-of-function research.
“We are not allowed to do any gain of function research with the viruses. But we're making these selective structural changes to see if we can make them more potent," Walker explained. At the same time, he seems mischievous
In the conversation, Walker hesitated at one point: "I don't know if I should say that." As he does so, he looks both ways, as if to make sure no one else is listening.
Is Pfizer considering mutating the coronavirus? the journalist asked.
"We don't say that publicly. That thought came up in a meeting,” Walker replies. There they thought, "why don't we do it". However, one is aware that "the people" would not like it.
At Pfizer, this would be discussed further. Walker described two methods to mutate the viruses:
One method is to infect monkeys with coronaviruses and let them infect other monkeys. From the resulting virus mutants, you then take the more infectious ones and infect other monkeys with them. This is how you actively and constantly mutate the viruses.
Even if Walker evaluated it differently in the conversation: This method is used in gain of function research.
The other method, which Walker says is not preferred by Pfizer, is to monitor how the proteins on the virus' surface

are changing and to intervene in a targeted manner so that the virus mutates in the desired direction.
In the further conversation, Walker revealed that experiments are taking place, but that they are proceeding slowly and carefully, after all they do not want to advertise that Pfizer wants to find out future virus mutations. In this way, prophylactic vaccines could be developed before these virus variants appeared in nature. When these variants are there, Pfizer already has the right vaccine.
That would then be the ultimate cash cow, said the journalist, and Walker agrees: "Yes, that would be perfect."

The revolving doors are "good for industry"

At the end of the hidden-camera video, Walker addressed the "revolving door effect." Officials reviewing Pfizer drugs would eventually switch to Pfizer. The same goes for government officials working for the army and defense. They would then work for the armaments industry.
"Pfizer is a revolving door for all government officials. […] That's pretty good for the industry, to be honest," says Pfizer director Walker and laughs. "It's bad for everyone else in America."
When the journalist asked why, Walker explained it in more detail: If the officials who are responsible for approving drugs want to work for the pharmaceutical company afterwards, then they shouldn't be so strict with the company where they receive their next job.

The Pfizer director reacted violently

When the reporter finally revealed himself, the situation escalated. This is reported by online media and documented by video recordings of a journalist's employee who was present.

Walker believed he was on a date with the undercover journalist and wanted to impress, he said afterwards: "I lied to impress someone on a date". Walker then pounced on the reporter and tried to take the iPad with the recording from him and his colleague. The massive use of force by Walker is documented in this video recording.

Deletions in response

Anyone who searched for "Pfizer Walker" on Google on the afternoon of January 27th received the following message:
This video was removed for violating YouTube's Community Guidelines
YouTube deleted the original video, although it is not fake and the statements are authentic. That's how quickly YouTube deletes a video when a corporation wants it. YouTube reacts much more slowly when a salaciously abused private individual or a slandered small organization requests a deletion. © YouTube

Questions from Infosperber on January 27, 3:05 p.m. to Pfizer have so far remained unanswered.
The big leading media have not yet informed about this.
