SARS-Cov-2: Peter Daszak's Research Plan

Dear Sir/Madam

Dear Contemporaries

As you might see from the documents published by the US organization Right to Know, which contain the research program of Peter Daszak & Co, who conducted research with Chinese researchers at the Wuhan Institute for Virology, this seems having been successfully met with the creation of SARS- Cov-2.

SARS-Cov-2 contains a furin cleavage site that was incorporated into the spike protein at the S1/S2 junction, making the virus the deadliest pandemic virus of the century. These enzymes, which also occur in the environment, can also be used in the laboratory to break down viruses. The chance to find them in the environment was rated as very low by scientists in 2022.

[US scientists proposed making viruses with features of SARS-CoV-2 in Wuhan \(usrtk.org\)](https://www.usrtk.org)

SARS-Cov-2 can be divided into six infectious genetic parts using genetic restriction enzymes.

The virus first spread without emerging widely among people. The finely tuned binding site for the ACE-2 receptors came out of the test tube fully formed and led to serious illnesses while scientists puzzled over its seemingly natural origin. The genome of SARS-Cov-2 still showed a 25% difference compared to that of SARS-Cov.

[PREEMPT Volume 1 no ESS HR00118S0017 EcoHealth Alliance DEFUSE \(wordpress.com\)](#)

The research program of Peter Daszak & Co, which records the individual steps of the research in Wuhan in detail, provides information about the experiments and manipulations to be carried out, but not about its effects on the cells and the immune system. These only became apparent after the release of the virus in Wuhan.

It is not credible that this program served to ward off a potentially new Corona virus. The idea that it is of natural origin and could have developed in host organisms such as marten dogs, as the virologist Christian Drosten stated in his podcasts, can no longer be maintained in view of this data. The ten-fold heightened binding capability to ACE-2 receptors in the tissue of the lungs by this virus, which caused thousands of deaths and many cases of long Covid speaks for itself.

The responsible authorities will have to decide whether in view of this data measures to control gain of function experiments have to be taken world-wide on the research for new mRNA-vaccines and whether in regard of the adverse effects of mRNA vaccines such as Spikopathy and Frameshifting, its distribution is still justifiable.

We can look forward to their decisions and the reasons behind it.
