Compound Adverse Effects of Covid-19 mRNA Vaccination and Corona-Virus Infection: A Convergence of Extensive Spike Protein Harms to the Human Body

Dear Sir/Madam

It has been claimed that the Covid-19 mRNA vaccination can reduce the severity of Covid-19 and its sequelae. The authors, working in medical institutions in the USA, counter this claim with evidence and moreover hypothesize, that the mRNA vaccination are triggering mechanisms that result in an amplification of Covid-19 morbidity along with the post-acute sequelae of Covid-19 termed as long Covid or post Covid.

Spike proteins resulting from both, the mRNA-vaccination and the natural SARS-Cov-2 infection have shown to persist for extended periods, raising concerns for long term safety with this vaccination. The fast-waning effect of this vaccination may lead to frequent vaccine breakthrough infections and re-infections.

Many if not most of the morbidity and mortality events, attributed to Covid-19 in extremely vaccinated populations in 2022-2023 due to long term persistence of spike protein and other vaccine associated toxicities have only been attributed to the virus, but not to the mRNA-vaccination. In their paper, the authors coin the phrase of "Hybrid Harms Hypothesis", which calls for re-examining the unique immunopathological dynamics of coronavirus-infection in COVID-19 mRNA-vaccinated individuals and their implications for public health strategies.

We hope you can study carefully all the facts and findings the authors have brought together to verify their hypothesis in many aspects, from the effect of vaccination before or after the first vaccination, the second or the third vaccination, over the role of co-morbidities or early vaccination in childhood on to the effect of carrier substances such as lipid nanoparticles or impurities (DNA) from the production of mRNA-vaccines or other forms of treatment or prevention, which have been disqualified by the Covid-19 vaccine lobby and leading media.

In our documents that you find at:

Felix.defries@gmail.com
https://www.immunity.org.uk/articles/felix-de-fries/

you can find links to articles on many of these topics that have been published since 2019 in well-known medical papers.

We hope that this article and these documents will help you form a clear picture of the issues surrounding COVID-19 and mRNA COVID vaccines today.
